P-PSDB; R98994.
Human vascular insulin-like growth factor binding protein-like growth factor, and its nucleic acid sequence and (ant)agonists - used, e.g. to treat muscle wasting diseases or aid implant fixation, or limit excess connective tissue prodn. during wound healing.
Claim 1; Page 42-43; 61pp; English.
A cDNA clone (T34991) codes for human vascular insulin-like growth factor binding protein-like growth factor (R98994), or VIGF, a protein structurally related to the IBP and CCN
                                                                                                                                                                                                    misc_difference

It was discovered in a cDNA library derived from hum umbilical vein endothellal cells. The cDNA can be used for prodn. of recombinant VIGF, e.g. by expression in E. coll, CHO or insect host cells. It is also useful therapeutically e.g. to treat muscle wasting diseases or osteoporosis, or to design probes for the detection of diseases associated with under-or over-expression of VIGF.

PT Pload gland specific gene-1 and corresponding protein - used in the PT treatment of pineal tumours and alleviation of side effect, e.g. PT precocious puberty, hydrocephalus etc.

PS Claim 1; Page 42; 56pp; English.

CC The present sequence represents a novel isolated polynucleotide complete the protein gland specific gene-1 (PGSG-1), which was derived from a human complete the protein gland tissue cDNA library. The PGSG-1 polypeptide may be used to treat pineal tumours and thereby treat the side effects, including complete the puberty, hydrocephalus, papilledema and other signs of complete the constant pressure. PGSG-1 and its protein may be used to regulate biological rhythms, in particular circadian rhythms, and to regulate pituitary secretion of hormones which regulate the onset of completely, e.g. luteinising hormone, follicular stimulating hormone (FSH) cand growth hormone (GH) released by the pituitary. The (ant)agonists which act against the protein may also be used to regulate the consection of these hormones. The PGSG-1 gene and proteins may also be used to

                                                                                                                                                                                                                                                                                              New nucleic acid encoding gamma subunits of human G protein - used of screen for agonists and antagonists of G protein interaction to detect mutation(s) in, or altered levels of, the subunits and to screen for agonists and antagonists of G protein interaction to the screen for agonists and antagonists of G protein interaction to the screen for agonists and antagonists of G protein interaction to gamma 1, page 29; 40pp; English.

C CDNA clones (T47669-75) respectively code for human G protein to gamma-2, gamma-3, gamma-4, gamma-5, gamma-7, gamma-10 and gamma-11 to gamma-2, gamma-1, gamma-10 to gamma-11 to sequence to identify expressed sequence tags (EST). By matching the sequences of EST to genes of known structure, the 7 new subunit the deposited as ATCC 97139. The cDNA clone for gamma-11 has been to groduce recombinant gamma subunits in prokaryotic or eukaryotic compositic cells for use in the development of therapeutic and diagnostic cells for use in the development of therapeutic and diagnostic cells for use in human G protein subunit sequences and for composition identification.

Chis cDNA clone codes for murine Fispl2 (see W35731), an extracellular matrix signalling molecule (ECM) that exhibits crucial similarity to Cyr61 (see W35730) and which, like Cyr61, influences cell adhesion, proliferation and migration. Creater, Fispl2 polynucleotides can be used for the production compositions are provided that comprise mammalian ECM signalling compositions are provided that comprise mammalian ECM signalling creating with receptors for ECM signalling molecules, peptide fragments, inhibitory peptides capable of interacting with receptors for ECM signalling molecules, and creating with receptors for ECM signalling molecules associated with angiogenesis, chondrogenesis and concogenesis; ex vivo methods for using ECM signalling molecules to prepare blood products are also provided.

                                                                     PT Nucleotide sequences hybridising to regions of chicken nov gene -
present as probes for detecting complementary sequences to
present as probes for detecting complementary sequences to
present and/or differentiation of tumours
claim 2; page 27; 67pp; French.

The chicken nov gene is stimulated in avian nephroblastoma induced
by avian myeloblastoma virus but not in normal adult kidney. A
claim 2; page 20; 67pp; French.

Chicken embryonic fibroblasts screened with a tumour-derived probe.
Fragment III is derived from the 2nd. exon of the nov gene;
nucleotide sequences which hybridise to Fragment III under stringent
conditions (i.e. 50% formamide, 5 x SCO) are claimed. The claimed
sequences preferably encode a protein with at least 70% homology to
R31600 which is encoded by Fragment III.

Sequence 230 BP; 18 A; 89 C; 97 G; 26 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TGF-beta induced gene family - encodes proteins involved in growth and differentiation effects of TGF-beta-1

Tgrowth and differentiation effects of TGF-beta-1

The DNA encoding mouse beta-IG-M2 was obtd. from AKR-2B mouse cells induced with TGF-beta1 and cyclohexamide. Poly RNA extracted from these cells was used to create a cDNA library which was screened using two probes. The probes were prepd. from untreated AKR-2B mRNA and AKR-2B mRNA from cells treated with cyclohexamide and TGF-beta1. Hybridising colonies were isolated and two clones (beta-IG-M1 and beta-IG-M2) were then sequenced. The DNA encodes proteins that have a 80 and 50 percent homology respectively with the CEF-10 protein induced by v-src in chicken embryo fibroblasts. The proteins encoded by TGF-beta induced genes are likely to be involved in mediation of the biological effects of TGF-beta relating to cell growth and differentiation.

              This sequence represents a hairpin forming probe of the invention. The probes comprise a segment complementary to the target nucleotide and are capable of forming at least 1 imperfect hairpin. The probes contain at least one acceptor label moiety and at least one donor moiety label which are covalently attached to the nucleotide sequence so that when the hairpins are formed the moietles are in close proximity to allow resonance energy transfer between them. This causes a reduction in the fluoresence of the two fluorophores. The target sequence contains at least 22 nucleotides to ensure specificity and avidity of the probetary thybridisation. The hairpins formed are imperfect hairpins and the intentional base pair mismatches are introduced into the competitive arms such that the specificity sequence will favour binding to the target sequence. Therefore when the probe interacts with the target sequence the competitive arm is displaced, increasing the distance between the fluorophores, resulting in a change in fluorescent emission.
                                                                                                                                                                                                                                                                          or more hairpins

                                   Q
                                                                                                    viseful as probes for detecting complementary sequences to evaluate development and/or differentiation of tumours claim 1; Fig 1; 67pp; French.

The chicken nov gene is stimulated in avian nephroblastoma induced to by avian myeloblastoma virus but not in normal adult kidney. The chicken embryonic fibroblasts screened with a tumour-derived probe. Chicken embryonic fibroblasts screened with a tumour-derived probe. Chicken embryonic fibroblasts screened with a tumour-derived probe. Chicken embryonic fibroblasts screened with a tumour-derived probe. Chicken embryonic fibroblasts screened with a tumour-derived probe. Chicken embryonic fibroblasts screened with a tumour-derived probe. Chicken embryonic fibroblasts screened with a tumour-derived probe. Chicken embryonic fibroblasts screened with a tumour-derived probe. Chicken was cloned in Bluescript KS+ to form plasmid pclK which was calaided used to screen a human placental DNA library. A nov-considered with hybridise to the chicken nov gene under stringent conditions (i.e. 50% formamide, 5 x SCC) are claimed.

A CDNA sequence (T51381) is the complementary strand of the Dirofilaria immitis nucleic acid nDivA833 (T51376), which codes helminth vA5-like gene nucleic acids (T51376-97) can be used to produce VA5-like proteins (W11480-86) either in vitro or in vivo. helminth Infection.

NR Nucleic acid encoding helminth venom allergen antigen 5-like protein representation birofilaria immitis or Onchocerca volvulus, useful esp. 1 n vaccines to prevent helminth infection

Claim 4; Page 89-90; 124pp; English.

C A cDNA clone (T51376), designated nDivA833, codes for the full-1 not compared to the full-1 not compared to the full-1 not compared to the full-1 not compared to the full-1 not compared privA221, of Dirofilaria immitis. It was isolated from 2 not compared to produce by 1 numitis cDNA library constructed from 3rd stage larvae by 2 nucleic acids (T51376-97) can be used to produce VA5-like gene nucleic acids (T51376-97) can be used to produce VA5-like proteins 2 (W11480-86) either in vitro or in vivo. The proteins elicit an 2 manune response that protects an animal from helminth infection.

TRESULT
TO THE SULT
his sequence represents the CDNA encoding the human connective tissue growth factor (CTGF). CTGF is related immunologically and biologically controlled to platelet-derived growth factor (PDGF), but is encoded by an unrelated gene. CTGF is thought to play a significant role in the normal connective was isolated by screening a cDMA library from human umbilical content was isolated by screening a cDMA library from human umbilical content was isolated by screening a cDMA library from human umbilical content was isolated by screening a cDMA library from human umbilical content with anti-PDGF antibodies. CTGF can be used to accelerate wound healing. Also, elevated levels of CTGF may be dispostic of proliferative diseases involving outgrowth of connective contistue cells, such as cancer, fibrotic disease and atheroscierosis. All content cells, such as cancer, fibrotic disease and atheroscierosis. All content cells, such as antibodies (which can also serve as assay reagents). Antisense culdeic acids, and ribozymes could also be used to inhibit CTGF concection. The advantage with using CTGF is that it is more stable, and cless susceptible to protease degradation than PDGF, and other growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 5; Column 15-18; 12pp; English.

CA cDNA clone (T04226), designated DB60R32, codes for human connective tissue growth factor (CTGF) (R79964), a protein that connective tissue growth factor (CTGF) (R79964), a protein that connective tissue cells and which binds to the platelet-derived growth factor (PDGR) receptor. The cDNA was obtd. from a library of human umbilical vein endothelial cell cDNA in vector lambda gtl1 by screening with an anti-PDGF antibody. The cDNA is useful for screening with an anti-PDGF antibody. The cDNA is useful for cribozyme constructs used to treat disorders associated with overgrowth of tissue cells, such as cancer, fibrotic diseases and atherosclerosis.

Claim 20; Page 50-52; 76pp; English.

C a CDNA clone (T45360) codes for novel human connective tissue growth factor (CTGF) (M09089), a PDGF-immunorelated protein that may play a close significant role in the normal development, growth and repair of the normal development, growth and repair of the following connective tissue cells, such as a growth factor in connective tissue cells, such as cancer, tumour connective tissue cells, such as cancer, tumour connective tissue cells, such as cancer, tumour connective tissue cells, such as cancer, tumour connective tissue cells, such as cancer, tumour connective tissue cells, such as cancer, tumour connective tissue cells, such as cancer, tumour connective tissue cells, such as cancer, tumour connective fibrosis, glaucoma) and atherosclerosis. The cDNA clone was closed from a HUVEC CDNA library using anti-PDGF antibody. CTGF uncleic acids can be used for recombinant prodn. of CTGF and as concleic acids can be used for recombinant prodn. of CTGF and as concleic acids can be used for recombinant prodn. of CTGF and as concleic acids can be used for recombinant prodn. of CTGF and as concleic acids can be used for recombinant prodn. of CTGF and as concleic acids can be used for recombinant prodn. of CTGF and as concleic acids can be used for recombinant prodn. of CTGF and as concleic acids can be used for recombinant prodn. of CTGF and as concleic acids can be used for recombinant prodn. of CTGF and as concleic acids can be used for recombinant prodn. of CTGF and as concleic acids can be used for recombinant prodn. of CTGF and as concleic acids can be used for recombinant prodn. of CTGF and as concleic acids can be used for recombinant prodn. of CTGF and as concleic acids can be used for recombinant prodn. of CTGF and as concleic acids can be used for recombinant prodn. of CTGF and as concleic acids can be used for recombinant prodn. of CTGF and as concleic acids can be used for recombinant prodn. of CTGF and as concleic acids can be use

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ameliorating cell proliferative disorder associated with connective tissue growth factor - comprises the administration of an antibody which binds to connective tissue growth factor and not to platelet-derived growth factor

PT platelet-derived growth factor

PT platelet-derived growth factor

PT platelet-derived growth factor

CA method has been developed for ameliorating a cell proliferative disorder associated with connective tissue growth factor (CTGF). The method comprises the administration of an antibody or its fragment that binds to CTGF and not to platelet-derived growth factor (PDGF), to the cite of the disorder. CTGF is related immunologically and biologically to PDGF. The present sequence encodes CTGF. The method is used to treat conditions involving the overgrowth of connective tissue cells such as cancer, atherosclerosis and other fibrotic diseases.

Claim 1; Page 50-51; 110pp; English.

Critis novel DNA molecule was isolated by screening a Trypanosoma cruzi cDNA expression library with pools of sera from infected individuals. It encodes T. cruzi with gools of sera from infected conditionals. It encodes T. cruzi with gools of sera graph code full-length antigens (see W2630-41), or epicope-containing repeat sequences (see W1904-102, W19079-86 and W26542-44) of native antigens, that can be used in a variety of immunoassays for detecting T. cruzi infection in a blood, serum, plasma, saliva, cerebrospinal fluid or urine sample. The polypeptides are also useful in vaccines and pharmaceutical compositions for inducing protective immunity against Chagas disease. The isolated DNA molecules can be used for recombinant production of the antigenic polypeptides.

ZHU X., LING N., SHIMASAKI S.;
BIOCHEM. BIOPHYS. RES. COMMUN. 190:1045-1052(1993).

-!- FUNCTION: IGF-BINDING PROTEINS PROLONG THE HALF-LIFE OF THE IGFS AND HAVE BEEN SHOWN TO EITHER INHEIT OR STIMULATE THE GROWTH PROMOTING EFFECTS OF THE IGFS ON CELL CULTURE. THEY ALTER THE INTERACTION OF IGFS WITH THEIR CELL SURFACE RECEPTORS.

-!- TISSUE SPECIFICITY: MOSTLY IN KIDNEY.

-!- SIMILARITY: BELONGS TO THE INSULIN-LIKE GROWTH FACTOR BINDING
                                                                                                                                                                                                                                                                                                         SIGNAL

CHEM. BIOPHYS. RES. COMMUN. 176:213-218(1991).

FUNCTION: IGF-BINDING PROTEINS PROJONG THE HALF-LIFE OF THE IGHT OF THE HALF-LIFE OF THE IGHT OF STIMULATE THE GROWTH AND HAVE BEEN SHOWN TO EITHER INHIBIT OR STIMULATE THE GROWTH PROMOTING EFFECTS OF THE IGFS ON CELL CULTURE. THEY ALTER THE INTERACTION OF IGFS WITH THEIR CELL SURFACE RECEPTORS.

TISSUE SPECIFICITY: OSTEOSARCOMA, AND AT LOWER LEVELS IN LIVER PRAYER AND BAT LOWER LEVELS IN LIVER
                                                                                                                                                                                                                                                                                                                      KIDNEY, AND BRAIN.
SIMILARITY: BELONGS TO THE INSULIN-LIKE GROWTH FACTOR BINDING

SUBMITTED (APR-1994) TO EMBL/GENBANK/DDBJ DATA BANKS.

11- FUNCTION: MAJOR CONNECTIVE TISSUE MITOATTRACTANT SECRETED BY
HUMAN VASCULAR ENDOTHELIAL CELLS. THIS IMMEDIATE-EARLY PROTEIN
MAY BIND ONE OF THE PDGF CELL SURFACE RECEPTORS.

11- SUBUNIT: MONOMER.
11- SUBUNIT: MONOMER.
11- ALTERNATIVE PRODUCTS: A SHORTER FORM MAY BE PRODUCED BY
ALTERNATIVE SPLICING OF THE SAME GENE.
11- ALTERNATIVE SPLICING OF THE INSULIN-LIKE GROWTH FACTOR BINDING
PROTEIN FAMILY. CEP-10/CYR61/CTFG/FISP-12/NOV PROTEIN SUBFAMILY.

11- SIMILARITY: CONTAINS 1 VMFC DOMAIN.

11- SIMILARITY: CONTAINS 1 C-TERMINAL CYSTINE KNOT-LIKE DOMAIN (CTCK)

FUNCTION: IGF-BINDING PROTEINS PROLONG THE HALF-LIFE OF THE IGAND HAVE BEEN SHOWN TO EITHER INHIBIT OR STIMULATE THE GROWTH PROMOTING EFFECTS OF THE IGFS ON CELL CULTURE. THEY ALTER THE INTERACTION OF IGFS WITH THEIR CELL SURFACE RECEPTORS.

SIMILARITY: BELONGS TO THE INSULIN-LIKE GROWTH FACTOR BINDING
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ISSUE=LIVER;

CANCER RES. 51:2813-2819(1991).
-!- FUNCTION: IGF-BINDING PROTEINS PROLONG THE HALF-LIFE OF THE IGFS AND HAVE BEEN SHOWN TO EITHER INHIBIT OR STIMULATE THE GROWTH PROMOTING EFFECTS OF THE IGFS ON CELL CULTURE. THEY ALTER THE INTERACTION OF IGFS WITH THEIR CELL SURFACE RECEPTORS.
-!- BINDS IGF-II MORE THAN IGF-I.
-!- SIMILARITY: BELONGS TO THE INSULIN-LIKE GROWTH FACTOR BINDING PROTEIN FAMILY.
